

Review of obligatory assignment 01_141628_Kerkenhoff.pdf

by Urs Oberdorf, 141627.

It starts with an short introduction which takes the reader through the basic purpose of the Trusted Path Concept. It is mentioned that OS X doesn't implement it but has other mechanisms which are well and understandable described by the author.

The only real critic I can think of is in "5 TPM in MAC OS X", where it is nowhere mentioned what TPM stands for and what it is.

As a notice for future reports should be also mentioned to install a language checker to prevent unnecessary spelling errors like in "4 File Quarantine" "...opnend...".

Except from that I think it is interesting and understandable written so have a **PASS**.
