Abstract

abstr

1 Is the mechanism described so that it is understandable to a knowledgeable reader while not being trivial?

In my opinion the mechanism is described in a easy to understand manner, it is perhaps room for a bit more detailed and in-depth explanation of how this SAK is realized, but i still feel like i got the general picture of how it worked.

2 Does the mechanism described as a Trusted path conform with the definition

In my opinion the mechanism that Gausdal has described conforms with the definition described the TCSEC.

3 Are references included that support the description of the mechanism?

He has included references taht support his description of hte mechanism, while wikipedia might not always be looked upon as the most trustworthy source, due to how it works, he has included documentation from a book on the subject(in this case he linked to the books.google site)

4 Bonus: Is there at least one reference that is not just a URL, but refers to a scientific article?

While not a scientific article, i feel that the google-books link is almost as good as one and i give him half a point for that.
