This is an article that in my opinion is very good. He first explains what a Trusted Path is and shows an easy example of how it is implemented in a well known OS before he goes on and writes about how it is implemented in Solaris. This makes it easy to follow through when it gets to how it works there.

The assignment was to write about how trusted path is implemented in a non-microsoft OS and as far as I can see that is what he has done in this article. It's also good that he has used many sources.

If I had to say one thing that could be done better I'd say he could have numbered the illustration to make it easier to see what he refers to in the text, but this is something that I would say does not affect the grading at all.

Mark: PASS :D
