

Review of 01_110074_Authen

Jan Kerkenhoff 141628

The Author described what a trusted path is and outlined what the questions were. He gives a good summary of the definition of the trusted path.

He describes the way SAK is implemented by various linux systems and the way to use it, including the different key combinations. And explains what happens on the system after these are pressed

He also gives one alternatives to get a trusted path in linux.

He used only a total of 2 sources not being the lecture, also there is no indication to which paragraph these sources relate to. Also they do mention the author of the articles there is no mention of when these were assessed, which should be included in this case since he is using weblinks. There is no mention of a source which is an scientific article.

Grade : Pass
