First, it is okay that you chose an operating system you are familiar with, but it not especially beneficial for the impression of the report as a whole to write that you have no knowledge about security in the operating system you chose. You probably shouldn't have written the introduction to your report before you finished your research. Later in your report you proves that you have understood the concept of trusted path and you have a good, easy to follow description of how the Secure Attention Key is incorporated in the OS.

It is also nice that you include a description of security features which are not default in Linux, but provide additional uses of a trusted path.

You also sort of met the last (bonus) criteria for the review by including a book as a reference. It is not a scientific article, but it is not "*just a URL*" either.
