The candidate is clearly describing what trusted path is and how it is implemented in the Linux distrubution. He's explaining the terminology in a way that people that isn't that technical can understand. The definition is explained in the beginning of the assignment which gives the reader an overview of what the writer is going to explain further down in the text.

He is mentioning two different kinds of realizations of the consept "secure attention key" and "trusted path execution". This gives the reader more information and background instead of just focusing on one of them. Personally I didn't know much of how trusted path was implemented in Linux but by reading this assignment it got explained on a really high level.

It's also a plus that he have a good reference list with references which is from books, and not only secondery references like wikipedia links.
