Review

First of all, kudos for choosing Solaris, a less popular operating system. Your report is short and well-written. The use of a figure showing what Solaris and Trusted Path looks like makes the report easy to understand and follow - even for a non-technical person.

The use of references is good. Most of them coming from Oracle's web page, but you also use the DoD standard, or the Orange Book, TCSEC. Thumbs up!

You demonstrate a good understanding of what Trusted Path is, and how it is incorporated into Solaris. You also mention the Secure Attention Key used in Solaris, with an example from Windows' implementation, which is a huge plus, since most people know the Windows operating system and thus can understand what SAK really is.
