Review of Assignment 1 - Software Security

Reviewer: David Vierheilig   Review of: Mr. Oberdorf

The student chose the Trusted Path in Linux. After a short introduction the reader knows about what the topic is. He explains exactly for what the Secure Attention Key is used and what the purpose of Secure Attention Key is. He describes that there are two ways to get into a Trusted Path and shows the two ways. He explains in detail why the Trusted Path Execution exists, how it works and in which cases it works. At the end he clarify the Trusted Path Execution on a example.

Generally speaking it was a good assignment and I would say it is PASSED.
