The Author explains core terminology e.g. the trusted path in a manner that most technical readers can understand, but sadly leaving out explanations for some of the terminology introduced in regard to the Solaris operating system. I do think that an in depth explanation of those terms are not necessary within the scope of this assignment, but as a reader I would like to have at least a high level description of the terminology. Readers that are not familiar with the Solaris operating system might have a more difficult time understanding the examples within the text. I will recommend using figures to help these users out. There seem to be is a high level of trustworthiness of the sources within the report as these is written by Oracle themselves, and the author also write down the name of authors of his sources, the title etc. For that the author deserves some credit, but I will encourage him in the future to also show in which paragraphs the different sources where used and possibly base his report on more sources.

Approved ☺
